

We have three tables with some sample data:

- 'users': This table stores user information and has attributes 'username', 'password', 'email'.

- 'modules': This table stores the individual module information; each module teaches something different.

- 'progress': This table stores user progress for individual modules and has the attribute 'progress'. There are foreign keys used in this table to link the users (foreign key `user_id`) and also to link each module (foreign key `mod_id`)
